

A complete range of Sweet® equipment has been installed at a grain facility in Salem, Ohio. The facility processes corn, soybean and bean meal at up to 81 MTPH and recently went through an expansion project. The project included a total of three new Silver-Sweet® legs and a Flite-Veyor® model 1417 incline drag conveyor. The equipment is supported by a new intermediate Tower and Silver Span® II catwalk. Additionally, this facility has installed a new Calormatic® Cardinal heat processor to enable drying of the soybeans. This facility is a good example of the full range of capability of Sweet's material handling product lines.
